Subject: Lady Annie Mine discharge

Dear All

Attached is a copy of preliminary results for filterable metals downstream of the lady Annie Mine. Also attached is a map showing the sample locations. Further samples have been submitted to the lab and we are expecting results late this week.

I would appreciate any comments you may have on these preliminary results. We will forward the final results as soon as they are available.

The EPA has been in regular contact with the landowners and will contact them to advise of these preliminary results.

Give me a call if you want to discuss

Regards

Rob

Mine Record Entry

This report forms part of the Mine Record under s59 of the Mining and Quarrying Safety and Health Act 1999. It must be placed in the Mine Record and displayed on Safety Notice Boards.

Note that inspection or audit activities conducted by the Mines Inspectorate are based upon sample techniques. It remains the primary responsibility of Mine Personnel to identify hazards, and risks associated with Operations and ensure those risks are at an acceptable level.

Accompanied by Mr Des LAFFIN (District Workers Representative) I attended site to conduct a general site safety inspection following recent heavy rain events. We were accompanied by Ms Jodie KIMBER (Senior Metallurgist) around the processing area, and then by Mr Paul MARTINKUS (SSE) around the storm water dams, ROM pad and mining areas (Lady Annie, Mt Clarke and Flying Horse).

With the exception of the SCP below, no major safety issues were observed during the inspection. We were also informed that the site had recently engaged a consultant to complete a geotechnical review following the recent rain. I have requested a copy of this report under section 151 of the Act when it becomes available.

Some damage was observed in the drainage infrastructure around site, although none of the damage appeared to impact on any safety issues. The damage to the storm dams was also inspected. Aside from the fact that at the time of inspection the ground was still too soft to use heavy machinery for repairs, no other safety concerns were observed at the dams

All mining areas and haul roads appeared to be in good condition at the time of inspection..

MRE No. Substandard Condition or Practice Ladders at the ROM Due Date 27/03/2009

During the inspection a number of permanent access ladders at the ROM were found to be damaged. Questions were also raised as to whether they also require safety cages due to the height of the ladders. The mine is to repair all damaged permanent ladders and audit all access ways to ensure that they comply with the Australian Standard 1657 and are suitably protected from damage from vehicular traffic.

Please notify me in writing with photographs when the above item is complete.

PATION PELENSE. ON PRIMI

Mr Damian Lee Inspector of Mines North Region Department of Mines and Energy PO Box 334 Mount Isa QLD 4825

19 March 2009

Dear Sir,

RE: Mine Record Entry - 24/02/09

Since the inspection all ladders in the crusher area have been examined to determine compliance with AS 1657. Four non-compliant ladders were found at the conveyor take up towers and the access point to the tail of CV002. The non-compliant ladders have been removed as shown in the attached photos.

All crushing and stacking activity ceased on Sunday March 8, 2009 as per the instructions of the Receiver / Manager. The ladders will be re-installed with the appropriate safety cages prior to the re-commencement of crushing operations, if or when that occurs in the future.

Yours sincerely
